Real World Testing Overview

Sunquest Laboratory provides a Meaningful Use Reportable Results Interface that sends reportable laboratory information to appropriate public health agencies. The Real World Testing plan outlines the approach to providing evidence that interfaces in use provide data that meets the 2015 Edition certification criterion 45 CFR 170.317(f)(3).

An outbound message count from a sample of clients using the interface to submit reportable results to their local agency will be generated for a minimum of 14 days during the 2023 calendar year. These successful outbound messages display evidence of real-world use of the certified capabilities.

Justification for Approach

Monitoring the generation of messages over a period of time (minimum 14 days) demonstrates evidence of the certified capability’s ongoing successful use rather than individual, on-demand evidence used during scripted testing. An automated process will count the messages daily without the need for human intervention.

Care Settings

Real World Testing will focus on the hospital laboratory care setting.

Expected Outcomes

Clinisys, Inc. expects to demonstrate that the Meaningful Use Reportable Results interface successfully creates and sends messages related to reportable laboratory information by accounting for the total number of messages generated over a period of time.

Key Milestone	Date
Identify participants	February 15, 2023
Begin data collection	April 1, 2023
End data collection	December 1, 2023
Analysis and report creation	January 2024
Submit Real World Testing Report	February 2024
